

TPA313xD2 4-W, 25-W Filter-Free Class-D Stereo Amplifier With AM Avoidance

1 Features

- Supports Multiple Output Configurations
 - 2×4 W into a 8- Ω BTL Load at 7.4 V (TPA3131D2)
 - 2×25 W into a 8- Ω BTL Load at 19 V (TPA3132D2)
- Wide Voltage Range: 4.5 V to 26 V
- Automotive Load-Dump Compliant
- Efficient Class-D Operation
 - >90% Power Efficiency Combined With Low Idle Loss for Heat Sink free Operation
 - Advanced Modulation Schemes
- Multiple Switching Frequencies
 - AM Avoidance
 - Master and Slave Synchronization
 - Up to 1.2-MHz Switching Frequency
- Feedback Power Stage Architecture With High PSRR Reduces PSU Requirements
- Programmable Power Limit
- Differential and Single-Ended Inputs
- Stereo and Mono Mode With Single-Filter Mono Configuration
- Single Power Supply Reduces Component Count
- Integrated Self-Protection Circuits Including Overvoltage, Undervoltage, Overtemperature, DC-Detect, and Short Circuit With Error Reporting
- Thermally Enhanced Package
 - 32-Pin VQFN Pad-Down
- -40°C to 85°C Ambient Temperature Range

2 Applications

- Laptop Computers and Ultrabooks
- Flatpanel TV
- Consumer Audio Applications

3 Description

The TPA313xD2 are efficient, stereo digital amplifier power stages for driving speakers with up to $2 \times 42\text{W}/4\Omega$ peak power. TPA3131/32D2 operates heatsink-free with cooling to PCB through the bottom side PowerPAD™ with sustained output power from 2×4 W / 8 Ω (TPA3131D2) to 2×25 W / 8 Ω (TPA3132D2).

The TPA313xD2 advanced oscillator/PLL circuit employs a multiple switching frequency option to avoid AM interferences; this is achieved together with an option of Master and Slave synchronization, making it possible to synchronize multiple devices.

The TPA313xD2 are fully protected against faults with short-circuit protection and thermal protection as well as overvoltage, undervoltage, and DC protection. Faults are reported back to the processor to prevent devices from being damaged during overload conditions.

For feature compatible devices see: PowerPAD up device $2 \times 50\text{-W}$ TPA3116D2, PowerPAD down $2 \times 15\text{-W}$ TPA3130D2 and $2 \times 30\text{-W}$ TPA3118D2.

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	PLIMIT	I	Power limit level adjust. Connect a resistor divider from GVDD to GND to set power limit. Connect directly to GVDD for no power limit.
2	GVDD	PO	Internally generated gate voltage supply. Not to be used as a supply or connected to any component other than a 1uF X7R ceramic decoupling capacitor.
3	GAIN/SLV	I	Sets Gain and selects between Master and Slave mode depending on pin voltage divider.
4	GND	G	Ground
5	INNL	I	Negative audio input for left channel. Biased at 3V.
6	INPL	I	Positive audio input for left channel. Biased at 3V.
7	MUTE	I	Mute signal for fast disable/enable of outputs: HIGH = outputs OFF (high-Z), LOW = outputs ON. TTL logic levels with compliance to AVCC.
8	AM2	I	AM Avoidance Frequency Selection
9	AM1	I	AM Avoidance Frequency Selection
10	AM0	I	AM Avoidance Frequency Selection
11	SYNC	DIO	Clock input/output for synchronizing multiple class-D devices. Direction determined by GAIN/SLV pin. Input signal not to exceed GVDD (7V)
12	AVCC	P	Analog Supply
13	PVCC	P	Power supply
14	PVCC	P	Power supply
15	BSPL	BST	Boot strap for positive left channel output, connect to 220nF X7R ceramic cap to OUTPL
16	OUTPL	PO	Positive left channel output
17	GND	G	Ground
18	OUTNL	PO	Negative left channel output
19	BSNL	BST	Boot strap for negative left channel output, connect to 220nF X7R ceramic cap to OUTNL
20	GND	G	Ground
21	GND	G	Ground
22	BSNR	BST	Boot strap for negative right channel output, connect to 220nF X7R ceramic cap to OUTNR

(1) **TYPE:** DO = Digital Output, I = Analog Input, G = General Ground, PO = Power Output, BST = Boot Strap.

Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
23	OUTNR	PO	Negative right channel output
24	GND	G	Ground
25	OUTPR	PO	Positive right channel output
26	BSPR	BST	Boot strap for positive right channel output, connect to 220nF X7R ceramic cap to OUTPR
27	PVCC	PI	Power supply
28	PVCC	PI	Power supply
29	SDZ	I	Shutdown logic input for audio amp (LOW = outputs Hi-Z, HIGH = outputs enabled). TTL logic levels with compliance to AVCC.
30	FAULTZ	DO	General fault reporting including Over-current_PVCC, OVP_DVDD FAULT1Z = High, normal operation FAULT1Z = Low, fault condition
31	INPR	I	Positive audio input for right channel. Biased at 3V.
32	INNPR	I	Negative audio input for right channel. Biased at 3V.
33	Thermal pad	G	Connect to GND for best system performance. If not connected to GND, leave floating.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage, V_{CC}	PV_{CC} , AV_{CC}	−0.3	30	V
Input voltage, V_I	INPL, INNPL, INPR, INNR	−0.3	6.3	V
	PLIMIT, GAIN / SLV, SYNC	−0.3	GVDD+0.3	V
	AM0, AM1, AM2, MUTE, SDZ	−0.3	PVCC+0.3	V
Slew rate, maximum	AM0, AM1, AM2, MUTE, SDZ		10	V/ms
Operating free-air temperature, T_A		−40	85	°C
Operating junction temperature, T_J		−40	150	°C
Storage temperature, T_{stg}		−40	125	°C

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	PV_{CC} , AV_{CC}	4.5		26	V
V_{IH}	High-level input voltage	AM0, AM1, AM2, MUTE, SDZ, SYNC	2			V
V_{IL}	Low-level input voltage	AM0, AM1, AM2, MUTE, SDZ, SYNC			0.8	V
V_{OL}	Low-level output voltage	FAULTZ, $R_{PULL-UP} = 100\text{ k}\Omega$, $PV_{CC} = 26\text{ V}$			0.8	V
I_{IH}	High-level input current	AM0, AM1, AM2, MUTE, SDZ ($V_I = 2\text{ V}$, $V_{CC} = 18\text{ V}$)			50	μA
$R_L(BTL)$	Minimum load Impedance	Output filter: $L = 10\text{ }\mu\text{H}$, $C = 680\text{ nF}$	3.2	4		Ω
$R_L(PBTL)$		Output filter: $L = 10\text{ }\mu\text{H}$, $C = 1\text{ }\mu\text{F}$	1.6			
L_O	Output-filter Inductance	Minimum output filter inductance under short-circuit condition	1			μH

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾⁽²⁾		TPA313xD2	UNIT
		VQFN	
		32 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	31.3	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2

7 Detailed Description

7.1 Overview

The TPA3132D2 device is a high-efficiency stereo Class-D audio power amplifier optimized for high-transient power capability to utilize the dynamic power headroom of small loudspeakers. It's capable of delivering high peak power into a 4-Ω speaker.

The device can be configured for either master or slave operation by using the SYNC pin. This helps to prevent audible beats noise.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Gain Setting and Master and Slave

The gain of the TPA3131D2 is set by the voltage divider connected to the GAIN/SLV control pin. Master or Slave mode is also controlled by the same pin. An internal ADC is used to detect the 8 input states. The first four stages sets the GAIN in Master mode in gains of 20, 26, 32, 36 dB respectively, while the next four stages sets the GAIN in Slave mode in gains of 20, 26, 32, 36 dB respectively. The gain setting is latched during power-up and cannot be changed while device is powered. shows the recommended resistor values and the state and gain:

Feature Description (continued)

Table 1. Gain and Master/Slave

MASTER / SLAVE MODE	GAIN	R1 (to GND)	R2 (to GVDD)	INPUT IMPEDANCE
Master	20 dB	5.6 kΩ	OPEN	60 kΩ
Master	26 dB	20 kΩ	100 kΩ	30 kΩ
Master	32 dB	39 kΩ	100 kΩ	15 kΩ
Master	36 dB	47 kΩ	75 kΩ	9 kΩ
Slave	20 dB	51 kΩ	51 kΩ	60 kΩ
Slave	26 dB	75 kΩ	47 kΩ	30 kΩ
Slave	32 dB	100 kΩ	39 kΩ	15 kΩ
Slave	36 dB	100 kΩ	16 kΩ	9 kΩ

Figure 19. Gain and Master/Slave Select Resistors

In Master mode, SYNC terminal is an output, in Slave mode, SYNC terminal is an input for a clock input. TTL logic levels with compliance to GVDD.

7.3.2 Input Impedance

The TPA313xD2 input stage is a fully differential input stage and the input impedance changes with the gain setting from 9 kΩ at 36 dB gain to 60 kΩ at 20 dB gain. Table 1 lists the values from min to max gain. The tolerance of the input resistor value is ±20% so the minimum value will be higher than 7.2 kΩ. The inputs need to be AC-coupled to minimize the output dc-offset and ensure correct ramping of the output voltages during power-ON and power-OFF. The input ac-coupling capacitor together with the input impedance forms a high-pass filter with the following cut-off frequency:

$$f = \frac{1}{2\pi Z_i C_i} \quad (1)$$

If a flat bass response is required down to 20 Hz the recommended cut-off frequency is a tenth of that, 2 Hz. lists the recommended ac-couplings capacitors for each gain step. If a -3 dB is accepted at 20 Hz 10 times lower capacitors can be used – for example, a 1 μF can be used.

Table 2. Recommended Input AC-Coupling Capacitors

GAIN	INPUT IMPEDANCE	INPUT CAPACITANCE	HIGH-PASS FILTER
20 dB	60 kΩ	1.5 μF	1.8 Hz
26 dB	30 kΩ	3.3 μF	1.6 Hz
32 dB	15 kΩ	5.6 μF	2.3 Hz
36 dB	9 kΩ	10 μF	1.8 Hz

Figure 20. Input AC Coupling

The input capacitors used should be a type with low leakage, like quality electrolytic, tantalum or ceramic. If a polarized type is used the positive connection should face the input pins which are biased to 3 Vdc.

7.3.3 Start-up/Shutdown Operation

The TPA313xD2 employs a shutdown mode of operation designed to reduce supply current (I_{CC}) to the absolute minimum level during periods of nonuse for power conservation. The SDZ input terminal should be held high (see specification table for trip point) during normal operation when the amplifier is in use. Pulling SDZ low will put the outputs to mute and the amplifier to enter a low-current state. It is not recommended to leave SDZ unconnected, because amplifier operation would be unpredictable.

For the best power-off pop performance, place the amplifier in the shutdown mode prior to removing the power supply. The gain setting is selected at the end of the start-up cycle. At the end of the start-up cycle, the gain is selected and cannot be changed until the next power-up.

7.3.4 PLIMIT Operation

The TPA313xD2 has a built-in voltage limiter that can be used to limit the output voltage level below the supply rail, the amplifier simply operates as if it was powered by a lower supply voltage, and thereby limits the output power. Add a resistor divider from GVDD to ground to set the voltage at the PLIMIT pin. An external reference may also be used if tighter tolerance is required. Add a 1 μ F capacitor from pin PLIMIT to ground to ensure stability.

Figure 21. Power Limit Example

The PLIMIT circuit sets a limit on the output peak-to-peak voltage. The limiting is done by limiting the duty cycle to a fixed maximum value. This limit can be thought of as a "virtual" voltage rail which is lower than the supply connected to PVCC. This "virtual" rail is approximately 4 times the voltage at the PLIMIT pin. This output voltage can be used to calculate the maximum output power for a given maximum input voltage and speaker impedance.

TPA3131D2, TPA3132D2

SLOS841B – SEPTEMBER 2013 – REVISED JANUARY 2015

www.ti.com

$$P_{OUT} = \frac{\left(\left(\frac{R_L}{R_L + 2 \times R_S} \right) \times V_P \right)^2}{2 \times R_L} \quad \text{for unclipped power}$$

where

- $P_{OUT} (10\%THD) = 1.25 \times P_{OUT} (\text{unclipped})$
- R_L is the load resistance.
- R_S is the total series resistance including $R_{DS(on)}$, and output filter resistance.
- V_P is the peak amplitude
- $V_P = 4 \times PLIMIT$ voltage if $PLIMIT < 4 \times V_P$ (2)

Increasing the PLIMIT voltage from a given value increases the maximum output voltage swing until it equals PVCC. Adjusting PLIMIT to a higher value will disable the PLIMIT function and will offer highest available output power, however for TPA3131D2 and TPA3132D2 it is always advised to use the PLIMIT function if PVCC is higher than nominal value to prevent shutdown due to over current protection. If PLIMIT is disabled on TPA3131D2 and TPA3132D2 an over current shutdown can occur with minimum recommended load impedance when PVCC is higher than its nominal value. To disable the PLIMIT function, the PLIMIT pin is simply connected to GVDD.

Figure 22. PLIMIT vs. Max. Output Power, 8Ω load

Figure 23. PLIMIT vs. Max. Output Power, 4Ω load

Table 3. Power Limit Example

MINIMUM PV _{CC} (V)	PART NUMBERS	PLIMIT VOLTAGE (V) ⁽¹⁾	R to GND	R to GVDD	OUTPUT POWER 8Ω (W)
7.4 V	TPA3131D2, TPA3132D2	1.85	27 kΩ	75 kΩ	4
12 V	TPA3132D2	2.87	39 kΩ	56 kΩ	10
19 V	TPA3132D2	4.26	56 kΩ	36 kΩ	25

(1) PLIMIT measurements taken with EVM gain set to 26dB and input level adjusted for 10% THD.

7.3.5 GVDD Supply

The GVDD Supply is used to power the gates of the output full bridge transistors. It can also be used to supply the PLIMIT and GAIN/SLV voltage dividers. Decouple GVDD with a X5R ceramic 1 μF capacitor to GND. The GVDD supply is not intended to be used for external supply. It is recommended to limit the current consumption by using resistor voltage dividers for GAIN/SLV and PLIMIT of 100 kΩ or more.

7.3.6 BSPx and BSNx Capacitors

The full H-bridge output stages use only NMOS transistors. Therefore, they require bootstrap capacitors for the high side of each output to turn on correctly. A 220 nF ceramic capacitor of quality X5R or better, rated for at least 16 V, must be connected from each output to its corresponding bootstrap input. (See the application circuit diagram in [Figure 29](#).) The bootstrap capacitors connected between the BSxx pins and corresponding output function as a floating power supply for the high-side N-channel power MOSFET gate drive circuitry. During each high-side switching cycle, the bootstrap capacitors hold the gate-to-source voltage high enough to keep the high-side MOSFETs turned on.

7.3.7 Differential Inputs

The differential input stage of the amplifier cancels any noise that appears on both input lines of the channel. To use the TPA313xD2 with a differential source, connect the positive lead of the audio source to the RINP or LINP input and the negative lead from the audio source to the RINN or LINN input. To use the TPA313xD2 with a single-ended source, ac ground the negative input through a capacitor equal in value to the input capacitor on positive and apply the audio source to either input. In a single-ended input application, the unused input should be ac grounded at the audio source instead of at the device input for best noise performance. For good transient performance, the impedance seen at each of the two differential inputs should be the same.

The impedance seen at the inputs should be limited to an RC time constant of 1 ms or less if possible. This is to allow the input dc blocking capacitors to become completely charged during the 10 ms power-up time. If the input capacitors are not allowed to completely charge, there will be some additional sensitivity to component matching which can result in pop if the input components are not well matched.

7.3.8 Device Protection System

The TPA313xD2 contains a complete set of protection circuits carefully designed to make system design efficient as well as to protect the device against any kind of permanent failures due to short circuits, overload, over temperature, and under-voltage. The FAULTZ pin will signal if an error is detected according to the fault table below:

Table 4. Fault Reporting

FAULT	TRIGGERING CONDITION (typical value)	FAULTZ	ACTION	LATCHED/SELF-CLEARING
Over Current	Output short or short to PVCC or GND	Low	Output high impedance	Latched
Over Temperature	$T_j > 150^{\circ}\text{C}$	Low	Output high impedance	Latched
Too High DC Offset	DC output voltage	Low	Output high impedance	Latched
Under Voltage on PVCC	$\text{PVCC} < 4.5\text{V}$	–	Output high impedance	Self-clearing
Over Voltage on PVCC	$\text{PVCC} > 27\text{V}$	–	Output high impedance	Self-clearing

7.3.9 DC Detect Protection

The TPA313xD2 has circuitry which will protect the speakers from DC current which might occur due to defective capacitors on the input or shorts on the printed circuit board at the inputs. A DC detect fault will be reported on the FAULT pin as a low state. The DC Detect fault will also cause the amplifier to shutdown by changing the state of the outputs to Hi-Z.

If automatic recovery from the short circuit protection latch is desired, connect the FAULTZ pin directly to the SDZ pin. This allows the DC Protection function to automatically drive the SDZ pin low which clears the DC Detect protection latch.

A DC Detect Fault is issued when the output differential duty-cycle of either channel exceeds 60% for more than 420 msec at the same polarity. Table x below shows some examples of the typical DC Detect Protection threshold for several values of the supply voltage. This feature protects the speaker from large DC currents or AC currents less than 2Hz. To avoid nuisance faults due to the DC detect circuit, hold the SD pin low at power-up until the signals at the inputs are stable. Also, take care to match the impedance seen at the positive and negative inputs to avoid nuisance DC detect faults.

The minimum output offset voltages required to trigger the DC detect are show in [Table 5](#). The outputs must remain at or above the voltage listed in the table for more than 420 msec to trigger the DC detect.

Table 5. DC Detect Threshold

PV _{CC} (V)	V _{OS} - OUTPUT OFFSET VOLTAGE (V)
4.5	0.96
6	1.3
12	2.6
18	3.9

7.3.10 Short-Circuit Protection and Automatic Recovery Feature

The TPA313xD2 has protection from over current conditions caused by a short circuit on the output stage. The short circuit protection fault is reported on the FAULTZ pin as a low state. The amplifier outputs are switched to a high impedance state when the short circuit protection latch is engaged. The latch can be cleared by cycling the SDZ pin through the low state.

If automatic recovery from the short circuit protection latch is desired, connect the FAULTZ pin directly to the SDZ pin. This allows the FAULTZ pin function to automatically drive the SDZ pin low which clears the short-circuit protection latch.

In systems where a possibility of a permanent short from the output to PVDD or to a high voltage battery like a car battery can occur, pull the MUTE pin low with the FAULTZ signal with a inverting transistor to ensure a high-Z restart, like shown in the figure below:

Figure 24. MUTE Driven by Inverted FAULTZ

Figure 25. Timing Requirement for SDZ

7.3.11 Thermal Protection

Thermal protection on the TPA313xD2 prevents damage to the device when the internal die temperature exceeds 150°C. There is a ±15°C tolerance on this trip point from device to device. Once the die temperature exceeds the thermal trip point, the device enters into the shutdown state and the outputs are disabled. This is a latched fault.

Thermal protection faults are reported on the FAULTZ terminal as a low state.

If automatic recovery from the thermal protection latch is desired, connect the FAULTZ pin directly to the SDZ pin. This allows the FAULTZ pin function to automatically drive the SDZ pin low which clears the thermal protection latch.

7.3.12 Efficiency: LC Filter Required with the Traditional Class-D Modulation Scheme

The main reason that the traditional class-D amplifier-based on AD modulation needs an output filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. The ripple current is large for the traditional modulation scheme, because the ripple current is proportional to voltage multiplied by the time at that voltage. The differential voltage swing is $2 \times V_{CC}$, and the time at each voltage is half the period for the traditional modulation scheme. An ideal LC filter is needed to store the ripple current from each half cycle for the next half cycle, while any resistance causes power dissipation. The speaker is both resistive and reactive, whereas an LC filter is almost purely reactive.

The TPA313xD2 modulation scheme has little loss in the load without a filter because the pulses are short and the change in voltage is V_{CC} instead of $2 \times V_{CC}$. As the output power increases, the pulses widen, making the ripple current larger. Ripple current could be filtered with an LC filter for increased efficiency, but for most applications the filter is not needed.

An LC filter with a cutoff frequency less than the class-D switching frequency allows the switching current to flow through the filter instead of the load. The filter has less resistance but higher impedance at the switching frequency than the speaker, which results in less power dissipation, therefore increasing efficiency.

7.3.13 Ferrite Bead Filter Considerations

Using the Advanced Emissions Suppression Technology in the TPA313xD2 amplifier it is possible to design a high efficiency class-D audio amplifier while minimizing interference to surrounding circuits. It is also possible to accomplish this with only a low-cost ferrite bead filter. In this case it is necessary to carefully select the ferrite bead used in the filter. One important aspect of the ferrite bead selection is the type of material used in the ferrite bead. Not all ferrite material is alike, so it is important to select a material that is effective in the 10 to 100 MHz range which is key to the operation of the class-D amplifier. Many of the specifications regulating consumer electronics have emissions limits as low as 30 MHz. It is important to use the ferrite bead filter to block radiation in the 30 MHz and above range from appearing on the speaker wires and the power supply lines which are good antennas for these signals. The impedance of the ferrite bead can be used along with a small capacitor with a value in the range of 1000 pF to reduce the frequency spectrum of the signal to an acceptable level. For best performance, the resonant frequency of the ferrite bead/ capacitor filter should be less than 10 MHz.

Also, it is important that the ferrite bead is large enough to maintain its impedance at the peak currents expected for the amplifier. Some ferrite bead manufacturers specify the bead impedance at a variety of current levels. In this case it is possible to make sure the ferrite bead maintains an adequate amount of impedance at the peak current the amplifier will see. If these specifications are not available, it is also possible to estimate the bead current handling capability by measuring the resonant frequency of the filter output at low power and at maximum power. A change of resonant frequency of less than fifty percent under this condition is desirable. Examples of ferrite beads which have been tested and work well with the TPA3130D2 can be seen in the TPA3130D2EVM user guide [SLOU341](#).

A high quality ceramic capacitor is also needed for the ferrite bead filter. A low ESR capacitor with good temperature and voltage characteristics will work best.

Additional EMC improvements may be obtained by adding snubber networks from each of the class-D outputs to ground. Suggested values for a simple RC series snubber network would be 18Ω in series with a 330 pF capacitor although design of the snubber network is specific to every application and must be designed taking into account the parasitic reactance of the printed circuit board as well as the audio amp. Take care to evaluate the stress on the component in the snubber network especially if the amp is running at high PVCC. Also, make sure the layout of the snubber network is tight and returns directly to the GND pins on the IC.

Figure 26. TPA311xD2 Radiated Emissions

7.3.14 When to Use an Output Filter for EMI Suppression

The TPA313xD2 has been tested with a simple ferrite bead filter for a variety of applications including long speaker wires up to 125 cm and high power. The TPA313xD2 EVM passes FCC class-B specifications under these conditions using twisted speaker wires. The size and type of ferrite bead can be selected to meet application requirements. Also, the filter capacitor can be increased if necessary with some impact on efficiency.

There may be a few circuit instances where it is necessary to add a complete LC reconstruction filter. These circumstances might occur if there are nearby circuits which are sensitive to noise. In these cases a classic second order Butterworth filter similar to those shown in the figures below can be used.

Some systems have little power supply decoupling from the AC line but are also subject to line conducted interference (LCI) regulations. These include systems powered by "wall warts" and "power bricks." In these cases, LC reconstruction filters can be the lowest cost means to pass LCI tests. Common mode chokes using low frequency ferrite material can also be effective at preventing line conducted interference.

Figure 27. Output Filter Configurations

7.3.15 AM Avoidance EMI Reduction

To reduce interference in the AM radio band, the TPA313xD2 has the ability to change the switching frequency via AM<2:0> pins. The recommended frequencies are listed in Table 6. The fundamental frequency and its second harmonic straddle the AM radio band listed. This eliminates the tones that can be present due to the switching frequency being demodulated by the AM radio.

Table 6. AM Frequencies

US	EUROPEAN				
AM FREQUENCY (kHz)	AM FREQUENCY (kHz)	SWITCHING FREQUENCY (kHz)	AM2	AM1	AM0
	522-540				
540-917	540-914	500	0	0	1
917-1125	914-1122	600 (or 400)	0	1	0
			0	0	0
1125-1375	1122-1373	500	0	0	1
1375-1547	1373-1548	600 (or 400)	0	1	0
			0	0	0
1547-1700	1548-1701	600 (or 500)	0	1	0
			0	0	1

7.4 Device Functional Modes

7.4.1 Mono Mode (PBTL)

The TPA313xD2 can be connected in MONO mode enabling up to 85W output power. This is done by:

- Connect INPL and INNPL directly to Ground (without capacitors) this sets the device in Mono mode during power up.
- Connect OUTPR and OUTNR together for the positive speaker terminal and OUTNL and OUTPL together for the negative terminal.
- Analog input signal is applied to INPR and INNR.

Figure 28. Output Mode select

8 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

This section describes a typical stereo speaker application with differential inputs. The amplifier gain is set to 26 dB and the output PWM is set to 400 kHz.

8.2 Typical Application

Figure 29. Typical Application Schematic

8.2.1 Design Requirements

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range PVCC	4.5 V to 26 V
PWM output frequencies	400 kHz, 500 kHz, 600 kHz, 1 MHz or 1.2 MHz
Maximum output power	25 Wx2 (TPA3132D2) or 4 Wx2 (TPA3131D2)

8.2.2 Detailed Design Procedure

The TPA31xxD2 is a very flexible and easy to use Class D amplifier; therefore the design process is straightforward. Before beginning the design, gather the following information regarding the audio system.

- PVCC rail planned for the design
- Speaker or load impedance
- Maximum output power requirement
- Desired PWM frequency

8.2.2.1 Select the PWM Frequency

Set the PWM frequency by using AM0, AM1 and AM2 pins.

8.2.2.2 Select the Amplifier Gain and Master/Slave Mode

In order to select the amplifier gain setting, the designer must determine the maximum power target and the speaker impedance. Once these parameters have been determined, calculate the required output voltage swing which delivers the maximum output power.

Choose the lowest analog gain setting that corresponds to produce an output voltage swing greater than the required output swing for maximum power. The analog gain and master/slave mode can be set by selecting the voltage divider resistors (R1 and R2) on the Gain/SLV pin.

8.2.2.3 Select Input Capacitance

Select the bulk capacitors at the PVCC inputs for proper voltage margin and adequate capacitance to support the power requirements. In practice, with a well-designed power supply, two 100- μ F, 50-V capacitors should be sufficient. One capacitor should be placed near the PVCC inputs at each side of the device. PVCC capacitors should be a low ESR type because they are being used in a high-speed switching application.

8.2.2.4 Select Decoupling Capacitors

Good quality decoupling capacitors need to be added at each of the PVCC inputs to provide good reliability, good audio performance, and to meet regulatory requirements. X5R or better ratings should be used in this application. Consider temperature, ripple current, and voltage overshoots when selecting decoupling capacitors. Also, these decoupling capacitors should be located near the PVCC and GND connections to the device in order to minimize series inductances.

8.2.2.5 Select Bootstrap Capacitors

Each of the outputs require bootstrap capacitors to provide gate drive for the high-side output FETs. For this design, use 0.22- μ F, 25-V capacitors of X5R quality or better.

8.2.3 Application Curves

Figure 30. Total Harmonic Distortion + Noise (BTL) vs Output Power

Figure 31. Total Harmonic Distortion + Noise (BTL) vs Output Power

9 Power Supply Recommendations

The power supply requirements for the TPA313xD2 device consist of one higher-voltage supply to power the output stage of the speaker amplifier. Several on-chip regulators are included on the TPA3116D2 device to generate the voltages necessary for the internal circuitry of the audio path. It is important to note that the voltage regulators which have been integrated are sized only to provide the current necessary to power the internal circuitry. The external pins are provided only as a connection point for off-chip bypass capacitors to filter the supply. Connecting external circuitry to these regulator outputs may result in reduced performance and damage to the device. The high voltage supply, between 4.5 V and 26 V, supplies the analog circuitry (AVCC) and the power stage (PVCC). The AVCC supply feeds internal LDO including GVDD. This LDO output are connected to external pins for filtering purposes, but should not be connected to external circuits. GVDD LDO output have been sized to provide current necessary for internal functions but not for external loading.

10 Layout

10.1 Layout Guidelines

The TPA313xD2 can be used with a small, inexpensive ferrite bead output filter for most applications. However, since the class-D switching edges are fast, it is necessary to take care when planning the layout of the printed circuit board. The following suggestions will help to meet EMC requirements.

- Decoupling capacitors — The high-frequency decoupling capacitors should be placed as close to the PVCC and AVCC terminals as possible. Large (100 μ F or greater) bulk power supply decoupling capacitors should be placed near the TPA313xD2 on the PVCC supplies. Local, high-frequency bypass capacitors should be placed as close to the PVCC pins as possible. These caps can be connected to the IC GND pad directly for an excellent ground connection. Consider adding a small, good quality low ESR ceramic capacitor between 220 pF and 1 nF and a larger mid-frequency cap of value between 100 nF and 1 μ F also of good quality to the PVCC connections at each end of the chip.
- Keep the current loop from each of the outputs through the ferrite bead and the small filter cap and back to GND as small and tight as possible. The size of this current loop determines its effectiveness as an antenna.
- Grounding — The PVCC decoupling capacitors should connect to GND. All ground should be connected at the IC GND, which should be used as a central ground connection or star ground for the TPA313xD2.
- Output filter — The ferrite EMI filter (see [Figure 27](#)) should be placed as close to the output terminals as possible for the best EMI performance. The LC filter should be placed close to the outputs. The capacitors used in both the ferrite and LC filters should be grounded.

For an example layout, see the TPA313xD2 Evaluation Module (TPA313xD2EVM) User Manual. Both the EVM user manual and the thermal pad application report are available on the TI Web site at <http://www.ti.com>.

10.2 Layout Example

Figure 32. Layout Example Top

Layout Example (continued)

Figure 33. Layout Example Bottom

10.3 Thermal Design

Main thermal path for cooling the device is from the bottom side PowerPAD through multiple via connections in the PCB to the bottom side ground plane. The high power efficiency allows TPA3131D2 to be operated continuously at rated output power into both 4-Ω and 8-Ω load, and TPA3132D2 into 8-Ω load using a PCB layout similar to what is used in the TPA3131D2/32D2 EVMs. The rated output power of TPA3132D2 into 4-Ω load will be available only for a limited duration of time when using a PCB layout similar to the EVM layout. Sustained power output into 4 Ω needs to be limited to prevent excess heating of the device. TPA3132D2 will be able to output full output power for a limited duration of time. The duration depends on the actual PCB layout. For the TPA3132D2 EVM layout the TPA3132D2 full output power with 4-Ω load can be illustrated with a burst test at room temp (25°C):

Table 7. TPA3132D2 EVM Burst Output Power

BURST RATIO	FULL POWER 1kHz	REDUCED POWER 1kHz (1/8 of full power)	MAXIMUM DEVICE TEMPERATURE	PCB TEMPERATURE (Bottom Side, Under Device)
1:3	1 Cycle 44 W / 4 Ω	2 Cycles 5.25 W / 4 Ω	116°C	85°C
2:5	2 Cycles 44 W / 4 Ω	3 Cycles 5.25 W / 4 Ω	143°C	102°C

It is not recommended to operate the device with a maximum temperature above 150°C.

Figure 34. TPA3132D2 EVM Temperature with 2:5 (42W/5.25W/4Ω) Burst Power

It is advised to use the PLIMT function to avoid thermal shutdown in system designs not using signal processing to limit the average output power. Such systems can accidentally exceed the thermal limits of the amplifier and a OTE shutdown will occur.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "--" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
