

# LM5106

***LM5106 100V Half Bridge Gate Driver with Programmable Dead-Time***

Literature Number: SNVS424B

# 100V Half Bridge Gate Driver with Programmable Dead-Time

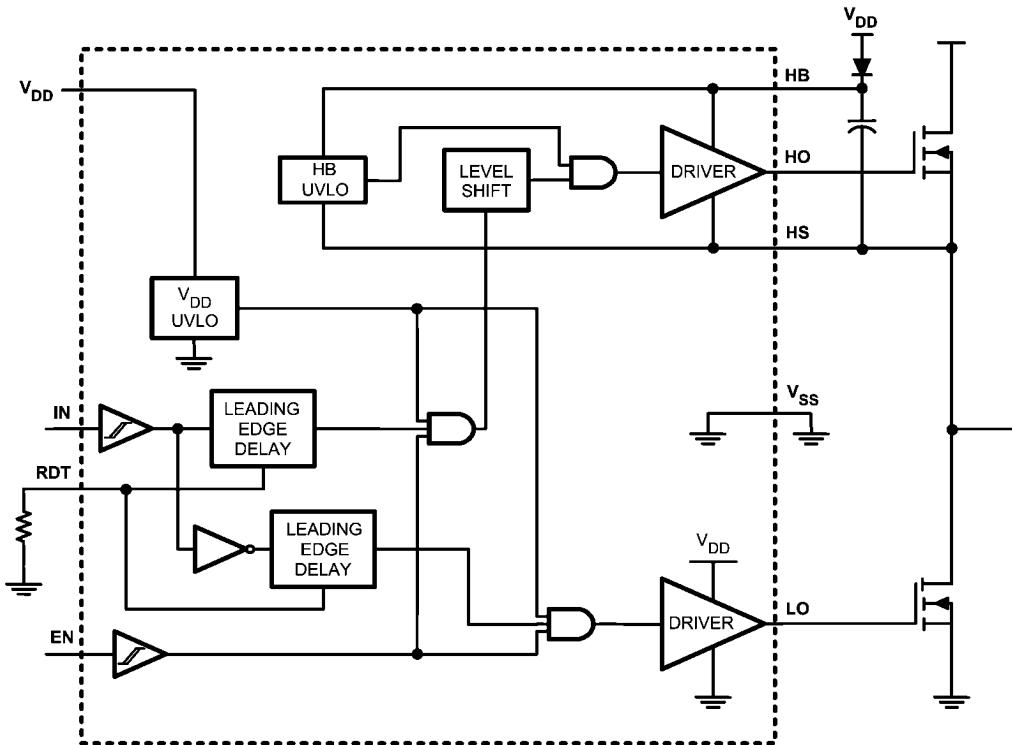

## General Description

The LM5106 is a high voltage gate driver designed to drive both the high side and low side N-Channel MOSFETs in a synchronous buck or half bridge configuration. The floating high side driver is capable of working with rail voltages up to 100V. The single control input is compatible with TTL signal levels and a single external resistor programs the switching transition dead-time through tightly matched turn-on delay circuits. The robust level shift technology operates at high speed while consuming low power and provides clean output transitions. Under-voltage lockout disables the gate driver when either the low side or the bootstrapped high side supply voltage is below the operating threshold. The LM5106 is offered in the MSOP-10 or thermally enhanced 10-pin LLP plastic package.

## Features

- Drives both a high side and low side N-channel MOSFET
- 1.8A peak output sink current
- 1.2A peak output source current

## Ordering Information

| Ordering Number | Package Type | NSC Package Drawing | Supplied As                 |
|-----------------|--------------|---------------------|-----------------------------|
| LM5106MM        | MSOP-10      | MUB10A              | 1000 shipped as Tape & Reel |
| LM5106MMX       | MSOP-10      | MUB10A              | 3500 shipped as Tape & Reel |
| LM5106SD        | LLP-10       | SDC10A              | 1000 shipped as Tape & Reel |
| LM5106SDX       | LLP-10       | SDC10A              | 4500 shipped as Tape & Reel |

## Pin Descriptions

| Pin | Name | Description                           | Application Information  |
|-----|------|---------------------------------------|--|
| 1   | VDD  | Positive gate drive supply            | Decouple VDD to VSS using a low ESR/ESL capacitor, placed as close to the IC as possible.  |
| 2   | HB   | High side gate driver bootstrap rail  | Connect the positive terminal of bootstrap capacitor to the HB pin and connect negative terminal to HS. The Bootstrap capacitor should be placed as close to IC as possible.                         |
| 3   | HO   | High side gate driver output          | Connect to the gate of high side N-MOS device through a short, low inductance path.  |
| 4   | HS   | High side MOSFET source connection    | Connect to the negative terminal of the bootstrap capacitor and to the source of the high side N-MOS device.   |
| 5   | NC   | Not Connected                         |  |
| 6   | RDT  | Dead-time programming pin             | A resistor from RDT to VSS programs the turn-on delay of both the high and low side MOSFETs. The resistor should be placed close to the IC to minimize noise coupling from adjacent PC board traces. |
| 7   | EN   | Logic input for driver Disable/Enable | TTL compatible threshold with hysteresis. LO and HO are held in the low state when EN is low.  |
| 8   | IN   | Logic input for gate driver           | TTL compatible threshold with hysteresis. The high side MOSFET is turned on and the low side MOSFET turned off when IN is high.  |
| 9   | VSS  | Ground return                         | All signals are referenced to this ground.   |
| 10  | LO   | Low side gate driver output           | Connect to the gate of the low side N-MOS device with a short, low inductance path.  |
| NA  | EP   | Exposed Pad                           | The exposed pad has no electrical contact. Connect to system ground plane for reduced thermal resistance.  |

## Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

|                                    |                                 |
|------------------------------------|---------------------------------|
| V <sub>DD</sub> to V <sub>SS</sub> | -0.3V to +18V                   |
| HB to HS                           | -0.3V to +18V                   |
| IN and EN to V <sub>SS</sub>       | -0.3V to V <sub>DD</sub> + 0.3V |
| LO to V <sub>SS</sub>              | -0.3V to V <sub>DD</sub> + 0.3V |
| HO to V <sub>SS</sub>              | HS - 0.3V to HB + 0.3V          |
| HS to V <sub>SS</sub> (Note 6)     | -5V to +100V                    |
| HB to V <sub>SS</sub>              | 118V                            |

|                           |                 |
|---------------------------|-----------------|
| RDT to V <sub>SS</sub>    | -0.3V to 5V     |
| Junction Temperature      | +150°C          |
| Storage Temperature Range | -55°C to +150°C |
| ESD Rating HBM (Note 2)   | 1.5 kV          |

## Recommended Operating Conditions

|                      |                     |
|----------------------|---------------------|
| V <sub>DD</sub>      | +8V to +14V         |
| HS (Note 6)          | -1V to 100V         |
| HB                   | HS + 8V to HS + 14V |
| HS Slew Rate         | <50V/ns             |
| Junction Temperature | -40°C to +125°C     |

## Electrical Characteristics

Specifications in standard typeface are for T<sub>J</sub> = +25°C, and those in **boldface type** apply over the full **operating junction temperature range**. Unless otherwise specified, V<sub>DD</sub> = HB = 12V, V<sub>SS</sub> = HS = 0V, EN = 5V. No load on LO or HO. RDT = 100kΩ (Note 4).

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the component may occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

**Note 2:** The human body model is a 100 pF capacitor discharged through a  $1.5\text{k}\Omega$  resistor into each pin. Pin 2, Pin 3 and Pin 4 are rated at 500V.

**Note 3:** 4 layer board with Cu finished thickness 1.5/1.0/1.0/1.5 oz. Maximum die size used. 5x body length of Cu trace on PCB top. 50 x 50mm ground and power planes embedded in PCB. See Application Note AN-1187.

**Note 4:** Min and Max limits are 100% production tested at  $25^\circ\text{C}$ . Limits over the operating temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods. Limits are used to calculate National's Average Outgoing Quality Level (AOQL).

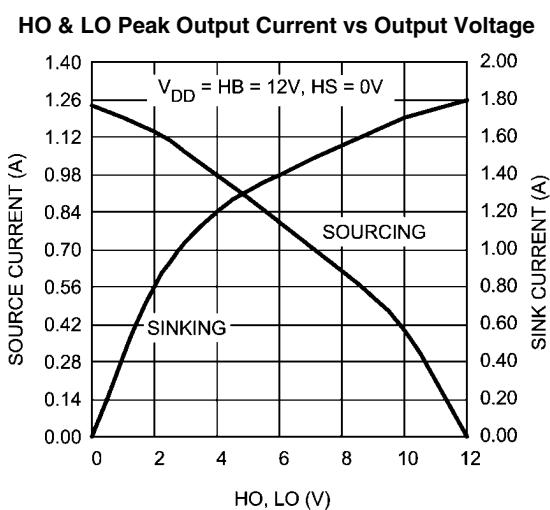

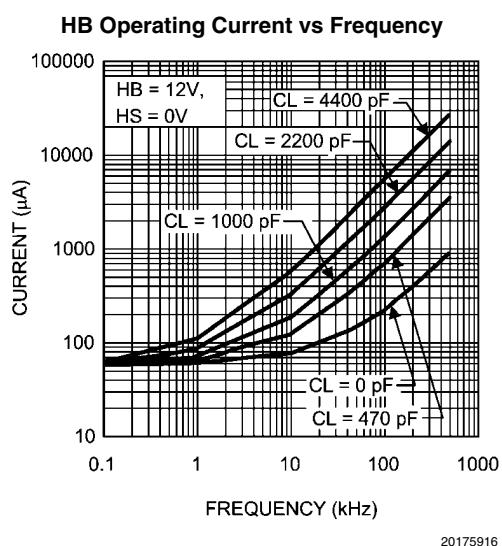

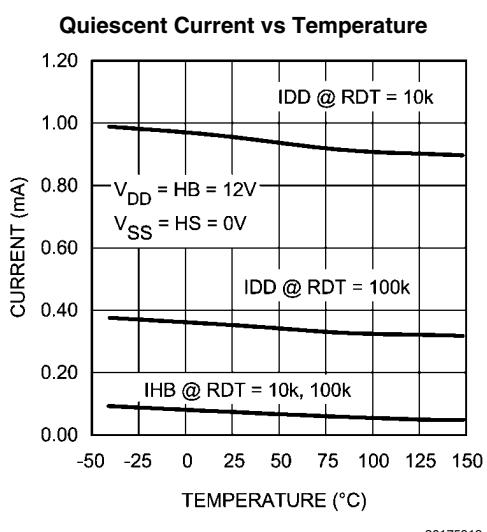

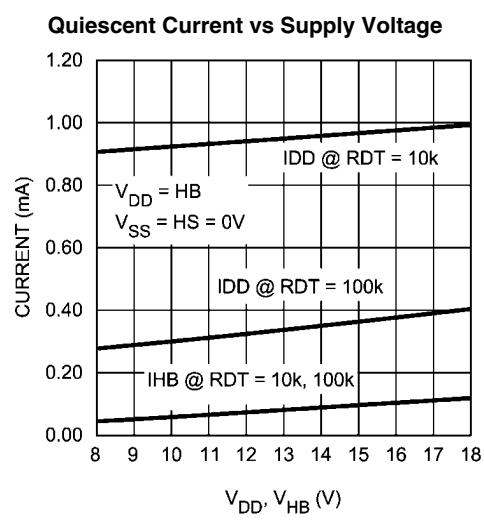

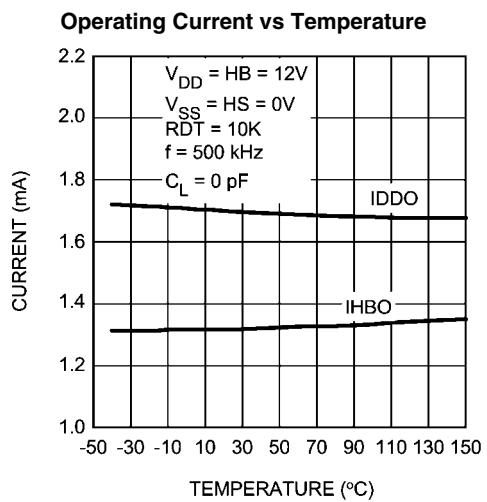

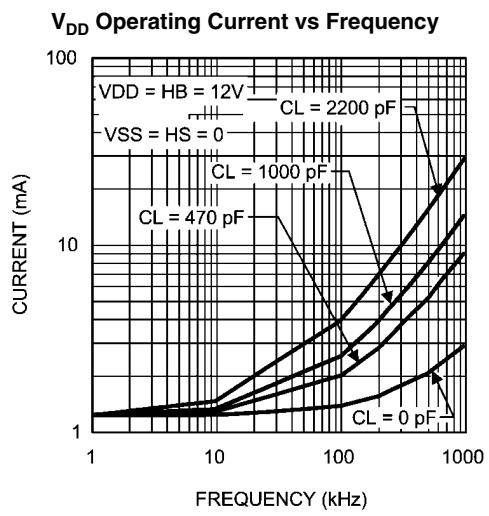

**Note 5:** The  $\theta_{JA}$  is not a constant for the package and depends on the printed circuit board design and the operating conditions.

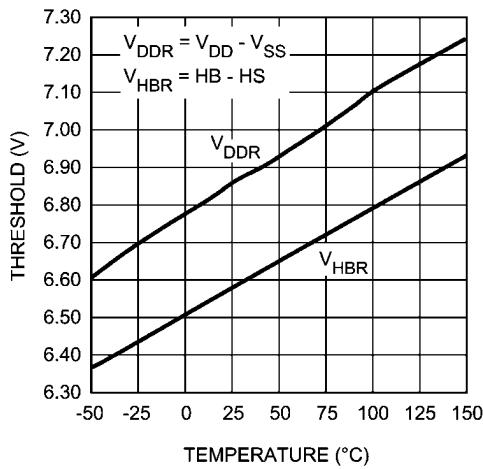

**Note 6:** In the application the HS node is clamped by the body diode of the external lower N-MOSFET, therefore the HS voltage will generally not exceed -1V. However in some applications, board resistance and inductance may result in the HS node exceeding this stated voltage transiently.

If negative transients occur on HS, the HS voltage must never be more negative than  $V_{DD} - 15\text{V}$ . For example, if  $V_{DD} = 10\text{V}$ , the negative transients at HS must not exceed -5V.

FIGURE 4. LM5106 Enable:  $t_{sd}$ 

## Operational Notes

The LM5106 is a single PWM input Gate Driver with Enable that offers a programmable dead-time. The dead-time is set with a resistor at the RDT pin and can be adjusted from 100ns to 600ns. The wide dead-time programming range provides the flexibility to optimize drive signal timing for a wide range of MOSFETs and applications.

The RDT pin is biased at 3V and current limited to 1 mA maximum programming current. The time delay generator will accommodate resistor values from 5k to 100k with a dead-time time that is proportional to the RDT resistance. Grounding the RDT pin programs the LM5106 to drive both outputs with minimum dead-time.

## STARTUP AND UVLO

Both top and bottom drivers include under-voltage lockout (UVLO) protection circuitry which monitors the supply voltage ( $V_{DD}$ ) and bootstrap capacitor voltage (HB – HS) independently. The UVLO circuit inhibits each driver until sufficient supply voltage is available to turn-on the external MOSFETs, and the UVLO hysteresis prevents chattering during supply voltage transitions. When the supply voltage is applied to the  $V_{DD}$  pin of the LM5106, the top and bottom gates are held low until  $V_{DD}$  exceeds the UVLO threshold, typically about 6.9V. Any UVLO condition on the bootstrap capacitor will disable only the high side output (HO).

## LAYOUT CONSIDERATIONS

The optimum performance of high and low side gate drivers cannot be achieved without taking due considerations during circuit board layout. The following points are emphasized:

1. Low ESR / ESL capacitors must be connected close to the IC between VDD and VSS pins and between HB and HS pins to support high peak currents being drawn from VDD and HB during the turn-on of the external MOSFETs.
2. To prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor and a good quality ceramic capacitor must be connected between the MOSFET drain and ground (VSS).
3. In order to avoid large negative transients on the switch node (HS) pin, the parasitic inductances between the source of the top MOSFET and the drain of the bottom MOSFET (synchronous rectifier) must be minimized.
4. Grounding considerations:
  - a) The first priority in designing grounding connections is to confine the high peak currents that charge and discharge the MOSFET gates to a minimal physical area. This will decrease the loop inductance and minimize noise issues on the gate terminals of the MOSFETs. The gate driver should be placed as close as possible to the MOSFETs.
  - b) The second consideration is the high current path that includes the bootstrap capacitor, the bootstrap diode, the local ground referenced bypass capacitor, and the low side MOSFET body diode. The bootstrap capacitor is

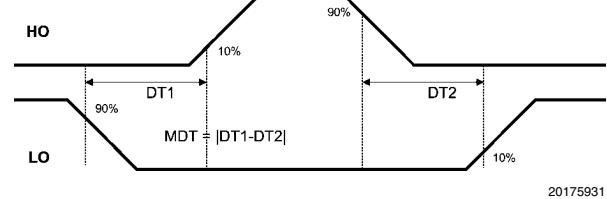

FIGURE 5. LM5106 Dead-time: DT

recharged on a cycle-by-cycle basis through the bootstrap diode from the ground referenced VDD bypass capacitor. The recharging occurs in a short time interval and involves high peak current. Minimizing this loop length and area on the circuit board is important to ensure reliable operation.

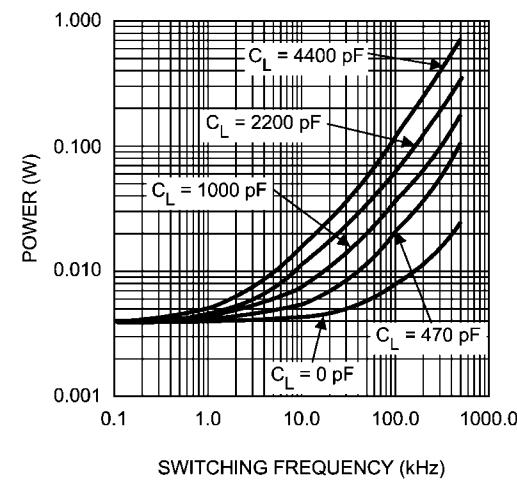

5. The resistor on the RDT pin must be placed very close to the IC and separated from the high current paths to avoid noise coupling to the time delay generator which could disrupt timer operation.

## POWER DISSIPATION CONSIDERATIONS

The total IC power dissipation is the sum of the gate driver losses and the bootstrap diode losses. The gate driver losses are related to the switching frequency ( $f$ ), output load capacitance on LO and HO ( $C_L$ ), and supply voltage ( $V_{DD}$ ) and can be roughly calculated as:

$$P_{DGATES} = 2 \cdot f \cdot C_L \cdot V_{DD}^2$$

There are some additional losses in the gate drivers due to the internal CMOS stages used to buffer the LO and HO outputs. The following plot shows the measured gate driver power dissipation versus frequency and load capacitance. At higher frequencies and load capacitance values, the power dissipation is dominated by the power losses driving the output loads and agrees well with the above equation. This plot can be used to approximate the power losses due to the gate drivers.

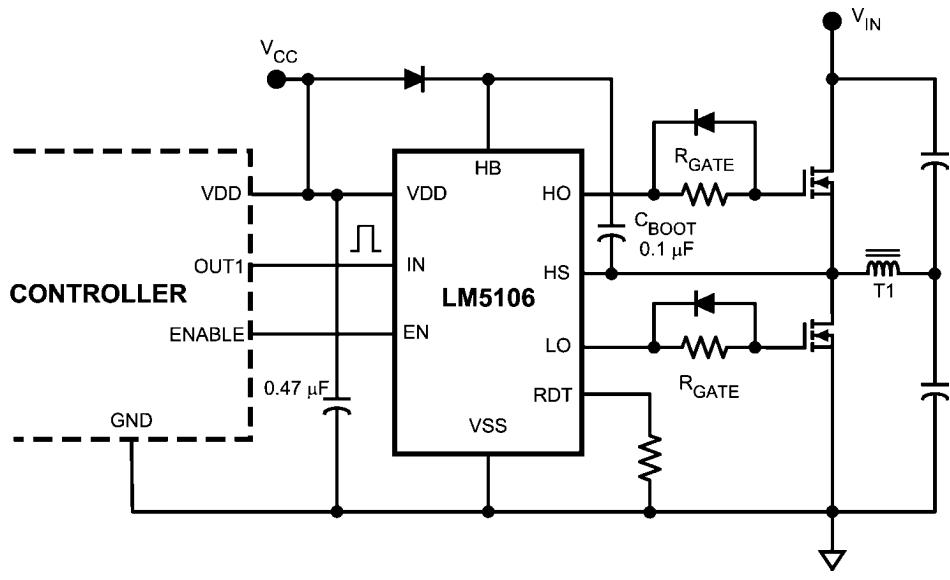

Gate Driver Power Dissipation (LO + HO)  
 $V_{CC} = 12V$ 

20175905

## HS TRANSIENT VOLTAGES BELOW GROUND

The HS node will always be clamped by the body diode of the lower external FET. In some situations, board resistances and inductances can cause the HS node to transiently swing several volts below ground. The HS node can swing below ground provided:

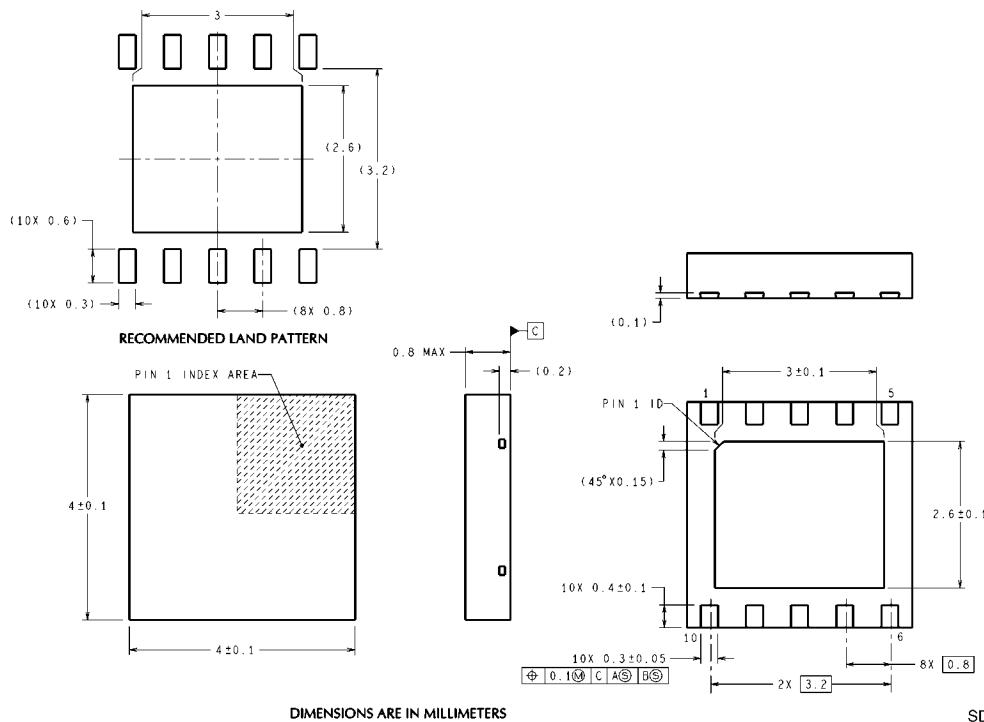

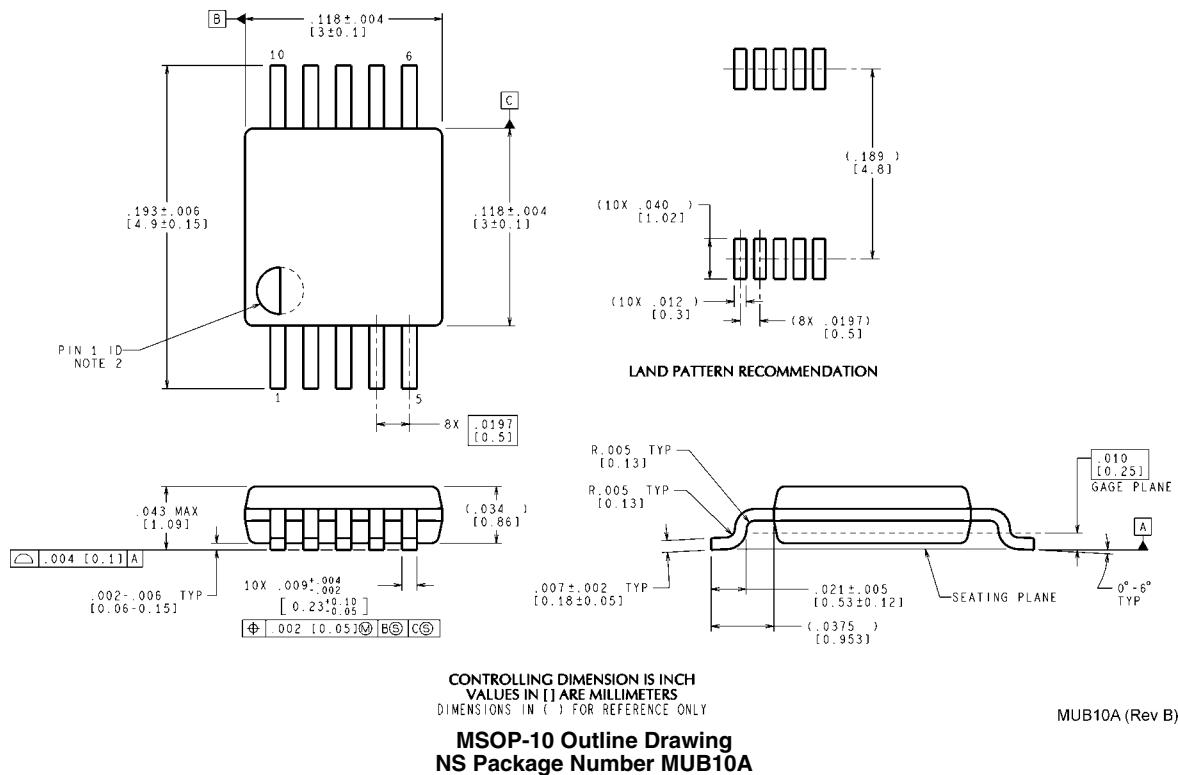

- HS must always be at a lower potential than HO. Pulling HO more than -0.3V below HS can activate parasitic transistors resulting in excessive current flow from the HB supply, possibly resulting in damage to the IC. The same relationship is true with LO and VSS. If necessary, a Schottky diode can be placed externally between HO and HS or LO and GND to protect the IC from this type of transient. The diode must be placed as close to the IC pins as possible in order to be effective.
- HB to HS operating voltage should be 15V or less. Hence, if the HS pin transient voltage is -5V, VDD should be ideally limited to 10V to keep HB to HS below 15V.
- Low ESR bypass capacitors from HB to HS and from VCC to VSS are essential for proper operation. The capacitor should be located at the leads of the IC to minimize series inductance. The peak currents from LO and HO can be quite large. Any inductances in series with the bypass capacitor will cause voltage ringing at the leads of the IC which must be avoided for reliable operation.

## Physical Dimensions

inches (millimeters) unless otherwise noted

Notes: Unless otherwise specified

1. Standard lead finish to be 200 microinches/5.00 micrometers minimum tin/lead (solder) on copper.
2. Pin 1 identification to have half of full circle option.
3. No JEDEC registration as of Feb. 2000.

LLP-10 Outline Drawing  
NS Package Number SDC10A

THE CONTENTS OF THIS DOCUMENT ARE PROVIDED IN CONNECTION WITH NATIONAL SEMICONDUCTOR CORPORATION ("NATIONAL") PRODUCTS. NATIONAL MAKES NO REPRESENTATIONS OR WARRANTIES WITH RESPECT TO THE ACCURACY OR COMPLETENESS OF THE CONTENTS OF THIS PUBLICATION AND RESERVES THE RIGHT TO MAKE CHANGES TO SPECIFICATIONS AND PRODUCT DESCRIPTIONS AT ANY TIME WITHOUT NOTICE. NO LICENSE, WHETHER EXPRESS, IMPLIED, ARISING BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT.

TESTING AND OTHER QUALITY CONTROLS ARE USED TO THE EXTENT NATIONAL DEEMS NECESSARY TO SUPPORT NATIONAL'S PRODUCT WARRANTY. EXCEPT WHERE MANDATED BY GOVERNMENT REQUIREMENTS, TESTING OF ALL PARAMETERS OF EACH PRODUCT IS NOT NECESSARILY PERFORMED. NATIONAL ASSUMES NO LIABILITY FOR APPLICATIONS ASSISTANCE OR BUYER PRODUCT DESIGN. BUYERS ARE RESPONSIBLE FOR THEIR PRODUCTS AND APPLICATIONS USING NATIONAL COMPONENTS. PRIOR TO USING OR DISTRIBUTING ANY PRODUCTS THAT INCLUDE NATIONAL COMPONENTS, BUYERS SHOULD PROVIDE ADEQUATE DESIGN, TESTING AND OPERATING SAFEGUARDS.

EXCEPT AS PROVIDED IN NATIONAL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, NATIONAL ASSUMES NO LIABILITY WHATSOEVER, AND NATIONAL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY RELATING TO THE SALE AND/OR USE OF NATIONAL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

### LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
